

## Hurricane Resources

Resource	Do they use Esri?	URL	Description of Application and GIS use cases for decision makers and GIS Admins	UI, tools, features, likes, dislikes
Storm surge planning zones	yes	<a href="#">Link</a>	This web map/app tells people whether or not they need to evacuate depending on the category of the hurricane.	The colors and the legend are easy to understand. This data is readily available for people to view anytime.
Disaster Preparedness Maps	yes	<a href="#">Link</a>	This website provides PDF maps showing areas at risk of storm surge and maps for evacuation routes.	These maps are not interactive as they are PDFs. Additionally, there is a link where people can enter their address and find out what storm surge zone they are in and what evacuation route they can use, but unfortunately, login information to ArcGIS is needed to access resource, so this would not be helpful for a person who is not a member of this organization and does not have access to it.
NOAA Hurricane Tracker	yes	<a href="#">Link</a>	This is an interactive map with satellite imagery that also shows hurricane paths.	This map is cool to look at as you can see what weather conditions are like at a glance. Tropical storms and hurricane paths are easy to see.
CNN Storm Tracker	?	<a href="#">Link</a>	This webpage shows current satellite imagery, rain forecast, and wind forecast for 48 hours in the future.	These maps are interesting to look at but will only provide visual information to viewers.
Miami-Dade County Hurricane Preparedness guide	yes	<a href="#">Link</a>	This webpage provides resources and information for citizens to prepare before a hurricane, what to do during a hurricane, and what to do after a hurricane.	I like how complete this website is. It provides people all the information they will need to stay safe during a storm and also to be well-informed during a storm.
